

# Worth automating does not mean **ready to automate.**

Readiness is not one question. It is four dimensions, and the weakest one governs whether an agent can run the process.

## Process

The process is documented, standardised and consistently run, with decisions that reduce to explicit rules, clear approvals, and a defined way of handling exceptions.

## Technology

The systems can be reached and acted on programmatically, are well integrated, allow non-human identities to execute actions, and offer a representative test environment.

## Knowledge

The operational know-how is documented, current, easy for a newcomer to find, and actively owned rather than living in people's heads.

## Data

The data needed to decide is complete and available, consistently defined, drawn from a single trusted source, clearly owned, and retained as queryable history.
